Therapeutic hypothermia has emerged as a very important treatment option for patients with cardiac arrest as it provides

significant protection from developing neurologic injury once the patient has been successfully resuscitated. Studies have demonstrated over 15% absolute risk reduction in death and neurologic injury using this therapy. Although hospitals and medical centers have become familiar with this important intervention it still remains greatly under utilized due to an experience and lack of resources to safely and effectively deploy such a program.

The objective of this book is to educate and familiarize both providers and institutions as to how to develop and deploy and provide therapeutic hypothermia to their patients. The current knowledge for this is provided by speakers and national experts and also by literature review. There are several courses being provided on this as well throughout the US. These are good venues for people to come and see and get hands on

experience, but there still needs to be a concrete book with references on how to go about getting this program started.

Patients with neurosurgical conditions are almost always referred from either primary care physicians, neurologists, internist or a specialist in family medicine. This guide will answer commonly asked questions about common neurosurgical conditions related to brain and spinal cord, in an attempt to fill in the gap and answer numerous questions that arises after a diagnosis is made on the loved ones. There are over 1500 academic and private hospitals in USA who have dedicated tertiary Neurosurgery services and cater

millions of people in need, in addition to numerous centers that have level I and II trauma care. We aim to reach these centers and the families of the patients undergoing neurosurgical procedures. This book has been specially written and illustrated for families of patients undergoing neurosurgical procedures. It is straightforward, with non-technical language explaining the basics of neurosurgical diseases and their management including legal, ethical and financial issues.

This book draws on the established European guidelines from the ESC that address the key issues in sudden cardiac death, such as identifying individuals at risk prior to an episode of ventricular tachyarrhythmia or a sudden cardiac arrest, and responding in a timely fashion to the person suffering the event out-of-the-hospital. It presents an update on what is known about sudden cardiac arrest, from basic experimental studies to

clinical trials, and serves as a complement to the ESC Core Syllabus on this subject. Topics include epidemiology, genetics, arrhythmogenic mechanisms, risk stratification, autonomic nervous system and phenotypes. Disease states and special populations are also covered, as well as drug, device and ablation treatments, and cost effectiveness. All chapters are co-authored by experts from both Europe and the US. The ESC Education Series This book is part of the ESC Education Series. The series is designed to provide medical professionals with the latest information about the understanding, diagnosis and management of cardiovascular diseases. Where available, management recommendations are based on the established European Guidelines, which encompass the best techniques to use with each cardiac disease. Throughout the series, the leading international opinion leaders have been chosen to edit and contribute to the books. The information is presented in a succinct and accessible format with a clinical focus.

**Cardiac Arrest** John Wiley & Sons  
Clinical cardiologists are encountering an important challenge in the caring of families with inherited cardiac diseases. The majority of the inherited cardiac diseases causing sudden death express themselves at variable ages in the form of altered muscle function (i.e hypertrophic or dilated cardiomyopathy) or in the form of arrhythmias (i.e. Brugada syndrome, long QT syndrome). However, it is not uncommon that the first sign of the disease may actually be sudden cardiac death, even before the identification of clear clinical abnormalities. In this last decade, with more than 50 new disease-associated genes identified, the possibility of genetic testing has opened a new opportunity to disease diagnosis and prevention. Clinical and genetic research is continuously on-going not only to

identify those at risk, but to better define their level or risk still with limited success.

*Rapid Cardiac Care* John Wiley & Sons  
Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the

life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

It was a cold January morning in the skies over Minnesota when, suddenly, in an

airplane at 30,000 feet, Patrick Emmett felt a discomfort in his chest, then a numbness in his hands and pain in his right shoulder. The flight attendant asked if he needed assistance, and then he collapsed into a sudden cardiac arrest and died on the spot. Only through the quick thinking of airline personnel and two passengers on the plane were they able to get Pat out of his seat to administer CPR, and eventually deliver a shock from an Automatic External Defibrillator (AED). A Second Chance: Surviving Sudden Cardiac Death also has a medical quick reference guide to wade through the many medical acronyms and the jargon common when referring to heart disease. The book is a must-read for anyone interested in heart health and saving lives.
