This is a book for medical students and first-year doctors who wish to learn how to approach a patient's symptoms, and sharpen their skills of clinical reasoning and diagnosis. Fifty-four presenting symptoms are discussed, covering approaches and conditions across various medical and surgical disciplines. Each chapter sets out the thought process behind history, examination, and investigations for a symptom, providing a systematic and practical algorithm to distinguish one differential from another. The reader will gain not only a functional approach to patients' presenting complaints, but also learn how to better organize and apply medical knowledge in diagnostic reasoning.  Radiologic evaluation of an infant or child suspected of having a surgical disease can be a complex problem. With this volume, the editors have created a book focused on pediatric imaging written by pediatricians, pediatric surgeons and pediatric radiologists. This book is a collection of over 200 case reports. The concept is

a case study approach: The reader is given radiologic images (plain radiography, computed tomography, magnetic resonance imaging, ultrasonography, etc.) and the clinical history of the patient. On the basis of this information, the reader is asked to identify a diagnostic and therapeutic strategy. Each case is complemented by information on the disease affecting the patient and the management of the case shown, including therapy and follow-up. This educational text is targeted at all medical professionals faced with a variety of diagnostic and therapeutic problems affecting infants and children.

Excerpt from *Differential Diagnosis and Treatment of Disease: A d104-Book for Practitioners and Advanced Students* To bring the broad domain of practical medicine fairly within the grasp of the family physician, and to assist the advanced student in acquiring a clinical foundation has been my aim. The general practitioner, representing the unity and connection of the various branches of medical practice, must grasp the practical details of his art in order to be useful at the bedside; and a book to be of value to the family physician should convey clinical experience Without the exhaustive and often purely theoretical details to be found and sought for in monographs. Such a work I have endeavored to write. It has been my desire to reestablish the relations of internal medicine, surgery, and the several specialties; for this reason I have presented special istic methods from the view - point of the general clinician. Disease is neither medical nor surgical nor does it hover on the border lines, but the treatment of disease has become more surgical and the arbitrary division into medical and surgical disease is no longer tenable. This unitarian principle should not be ignored in the presentation of disease, and many methods of diagnosis and treatment originally worked out by the specialist have become, or should become, common property. Drugs no longer dominate our therapeutics; therefore the prominence given to hygienic, prophylactic, dietetic, hydrotherapeutic, and physical methods of treatment. At the same time Well-tried and valuable formulae are distributed throughout the book. In prescription writing the apothecaries' weight and not the metric system has been used. However, simple rules for converting one into the other are given. The special chapters on the Technique of Diagnosis and Laboratory Aids, on Paediatrics, and the various specialties, on diseases of the Osseous, Muscular, and Articular System, on Nutrition and Diet, on the Management of Dropsy and Effusion, on Massage, Vibration, Dry Hot Air Treatment, Poisons and Anaesthesia, it is to be hoped will not be an unwelcome addition to a book on practice. Each chapter is prefaced by a synopsis of its contents and by brief introductory remarks on the clinical pathology of its subjects.
