The Spectral Analysis of Time Series - 1st Edition Spectral Analysis And Time Series Spectral Analysis Idea: decompose a stationary time series $\{X_t\}$ into a combination of sinusoids, with random (and uncorrelated) coefficients. Just as in Fourier analysis, where we decompose (deterministic) functions into combinations of sinusoids. This is referred to as 'spectral analysis' or analysis in the 'frequency' Introduction to Time Series Analysis. Lecture 15. The elementary text by Brockwell & Davis Introduction to Time Series and Forecasting presents the needed material on time series analysis. In Chapter 1, Priestly sets up the motivation for considering spectral analysis of stationary time series, and gives four practical reasons for the use of spectral methods. The purpose of spectral analysis is to decompose a time series into periodic components. We might consider doing this with a regression, where we regress the time series on a set of sine and cosine waves. Spectral Analysis of Time Series calculate the Fourier line spectrum for a number of shorter sub-series of the time series and average the line spectra of the subseries. The Spectral Analysis of Time Series - 1st Edition A key idea in time series is that of stationarity. Roughly speaking, a time series is stationary if its behaviour does not change over time. This means, for example, that the values always tend to vary about the same level and that their variability is constant over time.
