During a wide-reaching catastrophic public health emergency or disaster, existing surge capacity plans may not be sufficient to enable health care providers to continue to adhere to normal treatment procedures and follow usual standards of care. This is a particular concern for emergencies that may severely strain resources across a large geographic area, such as a pandemic influenza or the detonation of a nuclear device. Under these circumstances, it may be impossible to provide care according to the standards of care used in non-disaster situations, and, under the most extreme circumstances, it may not even be possible to provide basic life sustaining interventions to all patients who need them. Although recent efforts to address these concerns have accomplished a tremendous amount in just a few years, a great deal remains to be done in even the most advanced plan. This workshop summary highlights the extensive work that is already occurring across the nation. Specifically, the book draws attention to existing federal, state, and local policies and protocols for crisis standards of care; discusses current barriers to increased provider and community engagement; relays examples of existing interstate collaborations; and presents workshop participants' ideas, comments, concerns, and potential solutions to some of the most difficult challenges.

The effects of a disaster on healthcare can range from conditions that immediately besiege the system with large numbers of patients, to catastrophes that strain its long-term sustainability. Nurses, as frontline health professionals, must have an understanding of the situations they may face before, during and after a disaster and they must develop the skills and strategies to provide effective and immediate care. International Disaster Nursing is the first truly comprehensive and internationally focused resource to address the diversity of issues and myriad scenarios that nurses and other health personnel could encounter during a disaster event. This text defines the many roles of the nurse within a multidisciplinary team, and aids the implementation of the community's disaster plans in a crisis. With an alarming increase in the occurrence of disasters in the last decade, International Disaster Nursing is the hallmark text in the field.

The influenza pandemic caused by the 2009 H1N1 virus underscores the immediate and critical need to prepare for a public health emergency in which thousands, tens of thousands, or even hundreds of thousands of people suddenly seek and require medical care in communities across the United States. Guidance for Establishing Crisis Standards of Care for Use in Disaster Situations draws from a broad spectrum of expertise—including state and local public health, emergency medicine and response, primary care, nursing, palliative care, ethics, the law, behavioral health, and risk communication—to offer guidance toward establishing standards of care that should apply to disaster situations, both naturally occurring and man-made, under conditions in which resources are scarce. This book explores two case studies that illustrate the application of the guidance and principles laid out in the report. One scenario focuses on a gradual-onset pandemic flu. The other scenario focuses on an earthquake and the particular issues that would arise during a no-notice event. Outlining current concepts and offering guidance, this book will prove an asset to state and local public health officials, health care facilities, and professionals in the development of systematic and comprehensive policies and protocols for standards of care in disasters when resources are scarce. In addition, the extensive operations section of the book provides guidance to clinicians, health care institutions, and state and local public health officials for how crisis standards of care should be implemented in a disaster situation.

Principles of Emergency Management: Hazard Specific Issues and Mitigation offers preparedness and mitigation recommendations for advanced emergency planning. Because disasters are so unpredictable, advance planning is needed to effectively respond to and mitigate against the potential effects of such events. Whether a disaster is natural or man-made, accidental or deliberate, the best way to protect the public is by implementing an integrated emergency management system incorporating all potential stakeholders through all phases of the event. As such, the book suggests best practices for drills, exercises, and pre-event team building and communication. More than a dozen contributors offer their professional expertise on a wide variety of topics, including: Emergency operations center management Continuity planning of vital services in the aftermath of a disaster The role of the public health official Developing public-private partnerships Specific types of disasters, including terrorism, agroterrorism, pandemics, and active shooter incidents Mass care, sheltering, and human services The special needs of children in disasters Traditional and social media and their impact on emergency management The book is a valuable planning resource for those tasked with managing operations to prepare for, mitigate, and respond to disasters.

The lessons from this book help surgeons prepare for emergency events that require disaster preparedness usually handled by the United States military, including chemical attacks and massive casualty events. Written by experts in the field perspectives that come from various combat zones and disaster sites, this book highlights the pitfalls to avoid, the organization that is essential for success, and the tips to help perform surgery in the most austere conditions. The book will address situations where surgeons may have to operate on wanted criminals, operate wearing chemical protective equipment, operate in a collapsed building, or even remove an unexploded device. The book includes cases from the battlefield that are designed to guide surgeons facing these scenarios in the civilian world. There are also chapters detailing the lessons learned from the Boston Marathon Bombing, airline disasters, and the Oklahoma City bombing. Unlike any other current text, *Surgery During Natural Disasters, Combat, Terrorist Attacks, and Crisis Situations* is an excellent resource for all surgeons who might be faced with these events.

Following the September 11, 2001 attacks, experts from several academic medical centers formed the National Disaster Life Support Education Consortium (NDLSEC) to develop educational programs to meet a perceived lack of medical disaster preparedness. These institutions, along with the American Medical Association (AMA), established the AMA Committee on Disaster Preparedness and Emergency Response to coordinate efforts and resources to enhance the education and training of health care professionals. The NDLSEC has developed two courses, Basic Disaster Life Support (BDLS) and Advanced Disaster Life Support (ADLS). BDLS is the didactic component of the training and is presented in a traditional classroom setting via lecture and PowerPoint presentations. The curriculum has an all-hazards recognition and management approach, based on a unifying algorithm that organizes the providers' disaster planning and response. The curricula covers natural and manmade disasters; traumatic and explosive events; nuclear and biological weapon attacks; biological events; chemical events; medical decontamination; mitigating stress on health care workers; legal issues of disaster response; health care facility and disaster planning; and mass fatality incidents. Unlike ACLS and ATLS, participants can receive certification for completion of this didactic portion of the course.
