MIDDLETON SWANSON

Principles of Lighting
CRC Press
Understanding LED Illumination elucidates the science of lighting for light emitting diodes. It presents concepts, theory, simulations, and new design techniques that shine the spotlight on illumination, energy efficiency, and reducing electrical power consumption. The text provides an introduction to the fundamentals of LED lamp design, and highli

Fundamentals of Lighting
Illuminating Engineering
This comprehensive reference provides a practical, fully illustrated guide to design, specification, and application of state-of-the-art lighting, from the fundamentals of illumination to hands-on application. The full scope of light sources is examined and basic design methods for both indoor and outdoor lighting are presented,

along with optimum application strategies for merchandise, offices, industrial settings, floodlighting, parking lots and street lighting. The second edition features a new chapter on skylights for industrial buildings, covering layout parameters and daylight availability calculations used to predict skylight performance. The chapter on lighting retrofits has been revised to emphasize methods for analyzing potential retrofits, examining how retrofit results can be predicted, how to evaluate retrofit proposals, and how to avoid common mistakes. Lighting maintenance, as well as the economics of lighting design, including life cycle cost analysis, are also covered.

Recommended Practice for Marine Lighting Rp-12 Routledge

As our dependence on and need for abundant energy grows, it becomes increasingly important for engineers and managers to develop and maintain energy efficient systems and build effective energy management programs. Energy Management in Illuminating Systems presents the latest concepts, innovative methods, and state-of-the art technologies in commercial or industrial lighting systems and energy management. An effective energy management program comprises three essential elements: organization, technology, and economics. However, the success of any management program clearly must begin with an energy effective

illuminating system, which in turn depends upon using sound engineering analysis and design principles during the projects early stages. In this book, the author- with long and unique experience in the field- provides the details of proven methods for achieving these goals. He presents: How to organize and operate the illumination energy management program The elements of designing energy effective illuminating systems- systems that can also increase worker productivity and reduce operating costs The latest in efficient system components, including light sources, ballasts, and luminaires How to evaluate energy efficiency, including discussion of the impact of energy efficient equipment on power quality, harmonics, the ""K"" factor, and lighting energy standards Energy Management in Illuminating Systems shows how to design and manage energy effective lighting systems for industrial or commercial facilities. With this book, designers, engineers, and managers finally have a complete, how-to guide for applying practical energy management principles to various systems of illumination.

Lighting Design Handbook Springer

This book outlines the underlying principles on which interior lighting should be based, provides detailed information on the lighting hardware available today and gives guidance for the design of interior lighting

installations resulting in good visual performance and comfort, alertness and health. The book is divided into three parts. Part One discusses the fundamentals of the visual and non-visual mechanisms and the practical consequences for visual performance and comfort, for sleep, daytime alertness and performance, and includes chapters on age effects, therapeutic effects and hazardous effects of lighting. Part Two deals with the lighting hardware: lamps (with emphasis on LEDs), gear, drivers and luminaires including chapters about lighting controls and LEDs beyond lighting. Part Three is the application part, providing the link between theory and practice and supplying the reader with the knowledge needed for lighting design. It describes the relevant lighting criteria for good and efficient interior lighting and discusses the International, European and North American standards and recommendations for interior lighting. A particular focus is on solid state light sources (LEDs) and the possibility to design innovative, truly-sustainable lighting installations that are adaptable to changing circumstances. The design of such installations is difficult and the book offers details of the typical characteristics of the many different solid state light sources, and of the aspects determining the final quality of interior lighting. Essential reading for interior lighting

designers, lighting engineers and architects, the book will also be a useful reference for researchers and students. Reviews of Road Lighting by the same author: "If you are going to design streetlighting, you must read this book....a solid, comprehensive textbook written by an acknowledged expert in the field – if you have a query about any aspect of streetlighting design, you will find the answer here." – LUX, August 2015 "...a realy comprehensive book dealing with every aspect of the subject well...essential text for reference on this subject" – Lighting Journal, March 2015

Fundamentals of Illumination Engineering

Prentice Hall

This book outlines the underlying principles on which modern road lighting is based, and provides the reader with knowledge of how these principles should be applied in practice. This book offers a completely fresh approach to the subject, reflecting how the technology of road lighting has progressed to keep up with the changes in lamp technology, especially in solid state light sources, and the increasing awareness of energy use and environmental issues. The book is divided into three parts. Part One describes lighting of open roads, with chapters discussing visual performance and comfort (including the effects of mesopic vision and age), and international standards and recommendations for road lighting. Lighting equipment is introduced;

specifically lamps and luminaires in terms of their practical properties and features, but also the road surface and its characteristics. A chapter on Lighting Design makes the link between theory and practice, providing the reader with the knowledge needed for effective lighting design, including aspects relating to sustainability. The final chapter of Part One deals with lighting calculation conventions and measurements. Part Two is devoted to light pollution. The negative consequences of light pollution are described and tactics to restrict light pollution explained. Lighting criteria are defined that can be used by the lighting designer to guarantee installations stay within acceptable limits. International standards and recommendations on the restriction of light pollution are discussed. Part Three is devoted to tunnel lighting, with chapters discussing visual performance in tunnel environments, lighting criteria, standards and recommendations, and concluding with a chapter on tunnel lighting equipment and design. This book is a valuable resource for road lighting designers and engineers, students of lighting design and engineering, town planners, traffic engineers, environmental specialists, and lamp and luminaire developers and manufacturers.

Interior Lighting for Designers MacMillan Publishing Company

This invaluable reference book covers the fundamentals of stage

lighting, focusing on the qualitites of light, how to use available tools and how to process a lighting design

Understanding LED Illumination Illuminating Engineering

The IES Lighting Handbook is an indispensable reference for anyone involved in lighting, including practitioners, designers, architects, and engineers. It is a compendium of what is known that directly relates to lighting and lighting design. This new edition provides a new illuminance determination procedure consisting of visual age-based illuminance ranges and mesopic adaptation. Much information is conveniently summarized in tablular format and exemplied with numerous four-color photographs and illustrations. There is in-depth coverage of sustainability practices: new chapters on daylighting, controls, sustainability, commissioning and energy management

Fundamentals of Illumination Routledge

'Lighting Engineering: Applied Calculations' describes the mathematical background to the calculation techniques used in lighting engineering and links them to the applications with which they are used. The fundamentals of flux and illuminance, colour, measurement and optical design are covered in detail. There are detailed discussions of specific applications, including interior lighting, road lighting, tunnel lighting, floodlighting and

emergency lighting. The authors have used their years of experience to provide guidance for common mistakes and useful techniques including worked examples and case studies. The last decade has seen the universal application of personal computers to lighting engineering on a day-to-day basis. Many calculations that were previously impracticable are therefore now easily accessible to any engineer or designer who has access to an appropriate computer program. However, a grasp of the underlying calculation principles is still necessary in order to utilise these technologies to the full. Written by two of the leading authorities on this subject, 'Lighting Engineering' is essential reading for practising lighting engineers, designers and architects, and students in the field of lighting.

Road Lighting Springer Compared to traditional electrical filaments, arc lamps, and fluorescent lamps, solid-state lighting offers higher efficiency, reliability, and environmentally friendly technology. LED / solid-state lighting is poised to take over conventional lighting due to cost savings—there is pretty much no debate about this. In response to the recent activity in this field, Fundamentals of Solid-State Lighting: LEDs, OLEDs, and Their Applications in Illumination and Displays covers a range of solid-state devices, technologies, and materials used for lighting

and displays. It also examines auxiliary but critical requirements of efficient applications, such as modeling, thermal management, reliability, and smart lighting. The book discusses performance metrics of LEDs such as efficiency, efficacy, current–voltage characteristics, optical parameters like spectral distribution, color temperature, and beam angle before moving on to luminescence theory, injection luminescence, radiative and non-radiative recombination mechanisms, recombination rates, carrier lifetimes, and related topics. This lays down the groundwork for understanding LED operation. The book then discusses energy gaps, light emission, semiconductor material, special equipment, and laboratory facilities. It also covers production and applications of high-brightness LEDs (HBLEDs) and organic LEDs (OLEDs). LEDs represent the landmark development in lighting since the invention of electric lighting, allowing us to create unique, low-energy lighting solutions, not to talk about their minor maintenance expenses. The rapid strides of LED lighting technology over the last few years have changed the dynamics of the global lighting market, and LEDs are expected to be the mainstream light source in the near future. In a nutshell, the book traces the advances in LEDs, OLEDs, and their applications, and presents an up-to-date and analytical perspective of

the scenario for audiences of different backgrounds and interests.

As our dependence on and need for abundant energy grows, it becomes increasingly important for engineers and managers to develop and maintain energy efficient systems and build effective energy management programs. Energy Management in Illuminating Systems presents the latest concepts, innovative methods, and state-of-the art technologies in commercial or industrial lighting systems and energy management. An effective energy management program comprises three essential elements: organization, technology, and economics. However, the success of any management program clearly must begin with an energy effective illuminating system, which in turn depends upon using sound engineering analysis and design principles during the projects early stages. In this book, the author-with long and unique experience in the field-provides the details of proven methods for achieving these goals. He presents: How to organize and operate the illumination energy management program The elements of designing energy effective illuminating systems-systems that can also increase worker productivity and reduce operating costs The latest in efficient system components, including light sources, ballasts, and luminaires How to

evaluate energy efficiency, including discussion of the impact of energy efficient equipment on power quality, harmonics, the ""K"" factor, and lighting energy standards Energy Management in Illuminating Systems shows how to design and manage energy effective lighting systems for industrial or commercial facilities. With this book, designers, engineers, and managers finally have a complete, how-to guide for applying practical energy management principles to various systems of illumination.

IES Lighting Handbook

Meriwether Publishing

The theme of this book is that light is an inseparable part of architectural design, and is intended to provide students of architecture and interior design with a graphic guideline to the fundamental role lighting plays in this process. While simple light sources may be enough to satisfy practical needs, the design process must expand beyond basic illumination. The challenge for architects and designers is the creation of luminous environments offering visual interest and a sense of well-being, while also meeting basic seeing needs. Technological advances provide opportunities for the lighting designer's creative introduction of light, and the visual and psychological perceptions of the illuminated architectural environment. Fundamentals of Architectural Lighting offers a complete

comprehensive guide to the basics of lighting design, equipping students and practitioners with the tools and ideas they need to master a variety of lighting techniques. The book is extensively illustrated with over 250 illustrations to demonstrate basic principles and procedures. It is an excellent resource for anyone interested in the fundamentals of integrated lighting for architectural interior spaces.

A History of Light and Lighting Routledge

Disk contains: Lotus and Excel spreadsheets.

IESNA Lighting Ready Reference John Wiley & Sons

The book's organization follows a layered approach that builds on basic principles: Light as a Medium (Part 1), Tools of a Lighting Designer (Part 2), Design Fundamentals (Part 3), and Lighting Applications (Part 4). This presents students with a practical and logical sequence when learning basic concepts. The full spectrum of the lighting design process is presented in detail, giving students an example of how one might develop a lighting design from script analysis through concept and plot development, and all the way to an opening. This detailed process with a step-by-step design approach gives students a plan to work from, which they can later modify as they mature and gain confidence as designers. The text contains a more comprehensive discussion of basic technology, light as a physical phenomena, and methodology of

designs than is found in most introductory texts, bridging the gap between introductory and advanced lighting courses. The text will appeal to theatrical designers who want to venture into areas of lighting like architectural or virtual lighting design, while at the same time gaining a solid grounding in the fundmentals of lighting design. Lighting Design will also benefit illuminating engineers who want to move away from mere computational approaches in lighting and on to explore techniques along the design approaches of theatrical lighting design. The final 9 chapters cover many specialty areas of lighting design, highlighting the unique and shared qualities that exist between the different aspects of these elements. Discussions involve traditional entertainment areas like theatre, as well as lesser known facets of the industry including film/video, landscape lighting, retail/museum lighting, virtual lighting, concert, spectacle performances, and architectural lighting. Models of design tasks demonstrate the actual use and development of plots/sections, schedules, photometrics tables, and cut sheets, rather than simply talking about what they are. This hands-on approach provides students with a firm understanding of how to actually use these tools and processes.

Lighting Engineering: Applied Calculations CRC Press

This revised edition of the

successful primer thoroughly covers fundamentals of lighting design, and also serves as a handy reference for professional designers. The Fifth Edition is more comprehensive than ever, with new information on LED, energy efficiency, and other current issues. In addition, it includes more information for drawing ceiling floor plans and the application of designs to specific types of interiors projects. Considered a "key reference" for the Lighting Certified exam, no other text combines both technical and creative aspects of lighting design for beginners and novice designers.

Illumination Engineering for Energy Efficient Luminous Environments

Illuminating Engineering

This concise manual for lighting represents a compendium of the most useful information. The contents include: lighting terminology; conversion factors; light source data; reflectance data; transmittance data; illuminance selection; lighting calculation data; and cost analysis.

Light and Lighting and Environmental Design

Routledge

Lighting Technology offers a comprehensive and complete overview on the field It is based on a well-established German educational book on illuminating engineering, introducing the fundamentals of lighting technology and discussing concepts for good lighting and daylighting design. This book is widely used in German universities and has already helped generations of students to

graduate and kick-off their professional career in the field of lighting. Valuable contributions to this book came from a group of well-established lighting experts consisting of academics and design professionals. It covers the following key aspects: Fundamentals of Lighting Technology, Light Sources and Auxiliary Devices, Luminaires, Lighting Control, Illumination with Daylight, Illumination Systems for Interior Spaces, and Illumination Systems for Exterior Spaces. The motivation for this book was initiated in National lighting associations including but not limited to the German LiTG, the Dutch NSVV and the Intelligent Lighting Institute ILI of Eindhoven University of Technology with the goal to transfer expert knowledge to everybody interested in broadening his knowledge in the field of lighting technology and illuminating engineering, like university students, researchers and lighting designers. It is suitable to serve as a supportive source of knowledge and reference when studying lighting technology or pursuing a professional qualification as ELE (European Lighting Expert) offered by ELEA, the European Lighting Expert Association. The book provides all the knowledge necessary for working on and successfully completing innovative lighting projects.

Interior Lighting Springer This book brings together experts in the field who present material on a number of important and growing topics including

lighting, displays, solar concentrators. The first chapter provides an overview of the field of nonimagin and illumination optics. Included in this chapter are terminology, units, definitions, and descriptions of the optical components used in illumination systems. The next two chapters provide material within the theoretical domain, including etendue, etendue squeezing, and the skew invariant. The remaining chapters focus on growing applications. This entire field of nonimaging optics is an evolving field, and the editor plans to update the technological progress every two to three years. The editor, John Koshel, is one of the most prominent leading experts in this field, and he is the right expert to perform the task.

Energy Management in Illuminating Systems

Prentice Hall

Stage Lighting: The Fundamentals is written specifically for introductory stage lighting courses. The book begins with an examination of the nature of light, perception, and color, then leads into a conversation of stage lighting equipment and technicians. Lamps, luminaries, controls/dimming, and electricity form the basis of these chapters. The book also provides a detailed explanation and overview of the lighting design process for the theatre and several other traditional forms of entertainment. Finally, the book explores a variety of additional areas where

lighting designers can find related future employment, such as concert and corporate lighting, themed design, architectural and landscape lighting, and computer animation. New for this edition: enlarged full-color illustrations, photographs, light plots and examples of lighting design; updated information on LED lighting and equipment; expanded discussion of the practical use of color as a designer; expanded discussion of psychological/perceptual effects of color; new discussion of color mixing through light sources that make use of additive mixing; expanded discussion of industry professions; expanded discussion and illustrations relating to photometrics; expanded discussion and examples of control protocols and new equipment; and updated designer profiles along with the addition of still more designer profiles.

IESNA Lighting Ready Reference John Wiley & Sons

With the advent of increasingly more efficient light sources, interior lighting levels have continued to rise dramatically. However, in many cases these higher lighting levels caused more complaints than the previously lower lighting levels. This was because many of the lighting engineers who designed the newer lighting layouts ignored, or were ignorant of, many parameters that need to be considered other than illumination levels. A knowledgeable background in lighting

fundamentals includes a thorough understanding of such topics as equivalent sphere illumination, visual comfort probability, daylighting, and controls.
