Although the idea of using discrete methods for modeling partial differential equations occurred very early, the actual statement that cellular automata techniques can approximate the solutions of hydrodynamic partial differential equations was first discovered by Frisch, Hasslacher, and Pomeau. Their description of the derivation, which assumes the validity of the Boltzmann equation, appeared in the Physical Review Letters in April 1986. It is the intent of this book to provide some overview of the directions that lattice gas research has taken from 1986 to early 1989.

The French Revolutionary wars of the eighteenth century resulted in the overturning of the tradition of 'linear' warfare on the European battlefield by a new system of 'impulse' warfare primarily employed by the French Army and later adopted by their adversaries. Historians have placed great emphasis on Napoleon's leadership in defining the outcome of decisive battles of the period, but Brent Nosworthy argues this fails to appreciate the wealth of opportunities the new impulse system afforded to his subordinate commanders at the expense of their opponents. This book argues that successful minor tactics were the building blocks which enabled Napoleon to implement his grand tactical designs, best illustrated by the triumph of Austerlitz. Brent Nosworthy provides a wealth of detailed analysis of the various tactical doctrines employed by the main armies of the Revolutionary and Napoleonic period, giving fresh consideration to the theoretical versus practical handling of the three principal arms of infantry, cavalry and artillery. His approach yields many fascinating new insights into the tactical operations of the armies of the period based on close examination of primary sources.~

The heat transfer and analysis on laser beam, evaporator coils, shell-and-tube condenser, two phase flow, nanofluids, complex fluids, and on phase change are significant issues in a design of wide

range of industrial processes and devices. This book includes 25 advanced and revised contributions, and it covers mainly (1) numerical modeling of heat transfer, (2) two phase flow, (3) nanofluids, and (4) phase change. The first section introduces numerical modeling of heat transfer on particles in binary gas-solid fluidization bed, solidification phenomena, thermal approaches to laser damage, and temperature and velocity distribution. The second section covers density wave instability phenomena, gas and spray-water quenching, spray cooling, wettability effect, liquid film thickness, and thermosyphon loop. The third section includes nanofluids for heat transfer, nanofluids in minichannels, potential and engineering strategies on nanofluids, and heat transfer at nanoscale. The fourth section presents time-dependent melting and deformation processes of phase change material (PCM), thermal energy storage tanks using PCM, phase change in deep CO2 injector, and thermal storage device of solar hot water system. The advanced idea and information described here will be fruitful for the readers to find a sustainable solution in an industrialized society.

Quality control is a standard which certainly has become a style of living. With the improvement of technology every day, we meet new and complicated devices and methods in different fields. Quality control explains the directed use of testing to measure the achievement of a specific standard. It is the process, procedures and authority used to accept or reject all components, drug product containers, closures, in-process materials, packaging material, labeling and drug products, and the authority to review production records to assure that no errors have occurred. The quality which is supposed to be achieved is not a concept which can be controlled by easy, numerical or other means, but it is the control over the intrinsic quality of a test facility and its studies. The aim of this book is to share useful and practical knowledge about quality control in several fields with the people who want to improve their knowledge.

While faith in the Enlightenment was waning elsewhere by 1850, at the United States Military Academy at West Point and in the minds of academy graduates serving throughout the country Enlightenment thinking persisted, asserting that war was governable by a grand theory accessible through the study of military science. Officers of the regular army and instructors at the military academy and their political superiors all believed strongly in the possibility of acquiring a perfect knowledge of war through the proper curriculum. A Scientific Way of War analyzes how the doctrine of military science evolved from teaching specific Napoleonic applications to embracing subjects that were useful for war in North America. Drawing from a wide array of materials, Ian C. Hope refutes earlier charges of a lack of professionalization in the antebellum American army and an overreliance on the teachings of Swiss military theorist Antoine de Jomini. Instead, Hope shows that inculcation in West Point's American military curriculum eventually came to provide the army with

an officer corps that shared a common doctrine and common skill in military problem solving. The proliferation of military science ensured that on the eve of the Civil War there existed a distinctly American, and scientific, way of war.

Theranostics and Precision Medicine for the Management of Hepatocellular Carcinoma, Volume Two: Diagnosis, Therapeutic Targets and Molecular Mechanisms for Hepatocellular Carcinoma Progression provides comprehensive information about ongoing research and clinical data surrounding liver cancer. The book presents detailed descriptions about diagnostics and therapeutic options for easy understanding, with a focus on precision medicine approaches to improve treatment outcomes. The volume discusses topics such as computational approaches for identification of biomarkers, enzymes and pathways of HCC, circulating and epigenetic biomarkers, drug resistance, metabolic pathways, and small molecule-target therapies. In addition, it discusses immunotherapies, immune check point inhibitors and nanotechnology-based therapies. This book is a valuable resource for cancer researchers, oncologists, graduate students, hepatothologists and members of biomedical research who need to understand more about liver cancer to apply in their research work or clinical setting. Provides detailed information on traditional and novel diagnostic tools for hepatocellular carcinoma. Discusses promising targeted therapies, both available and in development, explaining the best option to use for specific cases. Brings recent findings in immunotherapies, immune checkpoint inhibitors and nanotechnology-based therapeutic approaches for treatment of HCC.

The 2016 2nd International Conference on Energy Equipment Science and Engineering (ICEESE 2016) was held on November 12-14, 2016 in Guangzhou, China. ICEESE 2016 brought together innovative academics and industrial experts in the field of energy equipment science and engineering to a common forum. The primary goal of the conference is to promote research and developmental activities in energy equipment science and engineering and another goal is to promote scientific information interchange between researchers, developers, engineers, students, and practitioners working all around the world. The conference will be held every year to make it an ideal platform for people to share views and experiences in energy equipment science and engineering and related areas. This second volume of the two-volume set of proceedings covers the field of Structural and Materials Sciences, and Computer Simulation & Computer and Electrical Engineering.

Volume 2 of 3. Originally published in 1849, this work gives details of "the life and services of every living officer in 'Her Majesty's Navy'" who was serving or had retired by 1845 - nearly 5,000 officers in all. Generally acknowledged as the most comprehensive work of its kind, it was a considerable undertaking for one man to piece together such detailed biographies. This information was compiled from official records and from details supplied by the officers themselves. The service details found on every page reflect the centuries-old naval traditions of devotion to duty and great bravery in the face of danger. They also provide information on the many naval actions that were fought at the end of the eighteenth and first half of nineteenth centuries. Coincidentally, the original publication took place during the year of issue of what is now referred to as the Naval General Service Medal. In 1847 Queen Victoria authorised this award to be struck to record the services of naval officers and men who took part in various actions between 1793 and 1815, later extended to 1840. The award was limited to those who were alive at the time of the announcement. Over 200 Naval actions were commemorated on clasps to this medal; details of these and a considerable number of other engagements are to be found throughout this volume. Over the century and a half since its publication, this work has established itself as an essential reference work for naval historians and for a wider section of the public who are in search of their naval ancestry.

The Biographical Encyclopedia of Astronomers is a unique and valuable resource for historians and astronomers alike. The two volumes include approximately 1550 biographical sketches on astronomers from antiquity to modern times. It is the collective work of about 400 authors edited by an editorial board of 9 historians and astronomers, and provides additional details on the nature of an entry and some summary statistics on the content of entries. This new reference provides biographical information on astronomers and cosmologists by utilizing contemporary historical scholarship. Individual entries vary from 100 to 1500 words, including the likes of the superluminaries such as Newton and Einstein, as well as lesser-known astronomers like Galileo's acolyte, Mario Guiducci. A comprehensive contributor index helps researchers to identify the authors of important scientific topics and treatises.
