 Concurrency Strategy Adaptation Using Learning State Machines
 Concurrent training involves the combined use of divergent exercise stimuli within either a specific training day or continuing programme. Considerations around acute and cumulative fatigue, antagonistic molecular signalling, and nutrient timing may influence recovery and subsequent adaptation to this mode of training.

 The relationship between implicit and explicit processes during motor learning, and for visuomotor adaptation in particular, is poorly understood. We set up a conflict between implicit and explicit processes by instructing subjects to counter a visuomotor rotation using a cognitive strategy in a pointing task.

 Diffusion adaptation allows the nodes to cooperate and diffuse information in real-time; it also helps alleviate the effects of stochastic gradient noise and measurement noise through a continuous learning process. We analyze the mean-square-error performance of the algorithm in some detail, including its transient and steady-state behavior.

 The cognitive strategy failed because subjects simultaneously adapted unconsciously to the rotation to the neighboring target. Notably, the rate of implicit adaptation to the neighboring target was not significantly different from rotation adaptation in the absence of an opposing explicit strategy.

 Learning strategies include: teaching study skills, editing assignments, reading strategies, and thinking strategies. Two examples of learning strategies that can be used with students who are alcohol- affected are the COPS strategy and the JETS strategy.
