 Developments in information and communication technology and networked computing over the past two decades have given rise to the notion of electronic government, most commonly used to refer to the delivery of public services over the Internet. This volume argues for a shift from the narrow focus of "electronic government" on technology and transactions to the broader

perspective of information government—the information flows within the public sector, between the public sector and citizens, and among citizens—as a way to understand the changing nature of governing and governance in an information society. Contributors discuss the interplay between recent technological developments and evolving information flows, and the implications of different information flows for efficiency, political mobilization, and democratic accountability. The chapters are accompanied by short case studies from around the world, which cover such topics as electronic government efforts in Singapore and Switzerland, the U.S. Environmental Protection Agency's effort to solicit input on planned regulations over the Internet, and online activism "cyberprotesting" globalization. The shortcomings in the standards, best practices and codes that relate to technology governance are discussed and recommendations have been made to enhance these to cater to technology governance. The book also lays down a reference model for technology governance, a road map for the implementation of technology governance and gives guidance for the assessment of technology governance in an enterprise. This book may prove to be the foundation of the new field of technology governance.
